NanoArmour for Biopharmaceuticals

NanoArmour is a highly effective way to enhance the stability of fragile drugs without the need for cold storage. This technology can eliminate the need for cold-chain transportation and extend the shelf-life of protein/DNA drugs and vaccines, which will significantly enhance the bioavailability of drugs.

Competitive advantage

- Extensive experience in nanotechnology research, design and development of biocompatible, responsive and ultra-stable nanocoatings for biomolecules
- Competitive IP ownership in relevant technology

Impact

- Enables fragile drugs to be available when cold storage is not accessible, e.g. during war or in third world countries
- Enables fragile drugs to last longer, e.g. ultra-long shelf-life of protein/DNA drugs or vaccines

Successful outcomes

- Successfully enhanced the stability of more than 50 proteins and DNA therapeutics to heat, UV, chemical and biological stressors.

Capabilities and facilities

- Experimental facilities to test the structural performance of nanocoating technology
- The ability to protect almost any form of biomolecule
- The ability to be transferred to a biocompatible ionic form (e.g. Ca^{2+} , Fe^{3+}) immediately before administration
